

## ELECTRIFICATION IN PROGRESS

14 DÉCEMBRE 2022

Today, TRBA is receiving its first 100% electric vehicles: four Polestar II cars, specially branded in our colors for the occasion. Convinced that electric cars are not the sole miracle solution but part of a broader set of lifestyle changes to adopt, TRBA will commit in the coming years to increasing its efforts to reduce CO<sup>2</sup> emissions. Our vehicles will gradually transition to electric, selecting brands that ensure advanced recycling and more responsible sourcing of materials. Our buildings will soon be equipped with solar roofs to produce clean, sustainable, and local electricity. Our thermal tools will progressively be replaced by electric tools, guaranteeing a quality of work at least equivalent. Vans equipped with solar panels to recharge tools are currently in the testing phase. Of course, TRBA is fully aware of the ecological footprint of the construction sector and has not waited until 2022 to act! For many years, our sites and production facilities have been carefully chosen and located near waterways, allowing us to transport materials by boat rather than by truck. Our fleet of machinery is regularly renewed to take advantage of the latest technologies in consumption and efficiency. Every step counts on the path to a decarbonized world. These are our four small contributions to building that future.
